Collisions and Casualties on London's roads 2011

December 2012

This report presents information on road traffic collisions occurring on the public highway involving personal injury in the Greater London area. These are collisions reported to the Metropolitan and City of London police services during 2011 in accordance with the *Stats 19* national reporting system.

The Greater London area comprises the 32 London boroughs and the City of London. It is the largest metropolitan area in Great Britain.

Data is presented on collisions, casualties injured and types of vehicles involved. These are presented in total and also analysed by the range of factors collected about each collision as part of the *Stats 19* system. Data has been presented to show the main collision, casualty and vehicle trends in Greater London during 2011 in each of the London boroughs. These factors include severity of collision and casualty, weather and road surface conditions, junction control, class of road user, age and gender of casualty, vehicle type and vehicle manoeuvre.

Introduction

1.1 Summary of general trends

In 2011, 24,443 personal injury collisions occurring on the public highway were reported to the Metropolitan and City of London police services within the Greater London area. This represents a slight increase of 1% over the 24,105 collisions recorded in 2010. These resulted in 29,257 casualties, an increase of 1% compared to the 28,889 recorded in 2010.

The previous casualty reduction targets had an end date of 2010. By this date, the number of people killed or seriously injured in road traffic collisions in the Capital had fallen by 57 per cent, the number of reported slight injuries had fallen by 33 per cent, and the number of children killed or seriously injured had fallen by 73 per cent compared to the 1994-8 baseline. This meant that 3,798 fewer people were killed or seriously injured on London's roads and 12,994 fewer slight injuries were reported in 2010 compared to the baseline years. Casualty reduction targets for cyclists and powered two-wheeler users, however, were not met. This may be largely reflected in the increased use of these modes.

While progress continued to be made in reducing killed and seriously injured casualties in 2011, 2,805 people were still killed or seriously injured on London's roads. Pedal cycle and pedestrian killed and seriously injured casualties increased by 22 per cent and 7 per cent respectively between 2010 and 2011. This is why the Mayor's revised Road Safety Action Plan prioritises action to address the issues facing London's vulnerable road users.

The long-term trend in total casualties over the last four decades has been downward, with total casualties in Greater London more than halving from the 1970s to the 2000s (see figure 1.10). The rate of decline has levelled more recently and some increases have been seen in 2010 and 2011 (see figures in section 1). Many factors may influence these increases such as changes in transport choices, behaviour and the effects of the weather.

During 2011, casualties in Greater London accounted for around 14% of those in Great Britain as a whole. KSI casualties represented 11% (source '*Reported Road Casualties Great Britain: Main Results 2011*' Department for Transport 2012).

The collisions and casualties occurred against a background in which total road traffic in London fell by 0.9% between 2009 and 2010 and the volume of traffic on London's roads over the last decade has declined by 6% overall. Whilst the trend towards falling traffic levels has been established in London for almost a decade, 2008 saw the first falls in traffic volume at the national level since the mid 1970s. This was repeated in both 2009 and 2010, with UK traffic in 2010 being 3.3 per cent lower than the high point of 2007. (source *Travel in London Report 4 Transport for London, 2011*).

The cost to the community of collisions in Greater London for the year 2011 is estimated to be around £2.3 billion at 2010 prices (see *Section 5: Collision costs*). Resources will therefore continue to need to be invested in a targeted way in future road safety programmes. This will enable activity to target those audiences and locations suffering from high levels of road casualties.

Developing a London-wide Road Safety Action Plan is one of the proposals in the Mayor's Transport Strategy. In July 2012 Transport for London issued its draft Road Safety Plan for consultation. The Plan proposes to achieve a 40 per cent reduction in the number of people killed and seriously injured measured against a 2005-9 average baseline. More details can be found on TfL's Road Safety website; www.tfl.gov.uk/roadsafety

1.2 Background

This report provides background information on personal injury road traffic collisions on the public highway occurring within the Greater London area and reported to the police. This information will assist in policy formulation for road safety, traffic and transport planning studies, the production of road safety plans, and for reference purposes.

This is the 25th annual report published by Transport for London and its predecessor organisations.

Further analysis of London's collision and casualty data can be found in the various publications produced by TfL and are available via our website; www.tfl.gov.uk/roadsafety

The tables and graphical illustrations are those most commonly requested and not an exhaustive list of possible analyses of the data. Additional tabulations of collision, casualty and vehicle factors associated with personal injury collisions may be available on request (see appendices).

Appendix 6.1 provides information about changes in the coverage and reporting of collisions that it is important to be aware of when considering very long term trends.

Casualty Trends

Please see Section 6: Appendices for important notes about comparing collision data from year to year.

¹ TLRN is the Transport for London Road Network.

Note: the highway authority is allocated according to the category of the road at which the collision occurred. For a collision occurring at a junction where the collision cannot be clearly allocated to a particular road the highway authority of the major road is chosen.

¹ TLRN is the Transport for London Road Network.

Note: the highway authority is allocated according to the category of the road at which the collision occurred. For a collision occurring at a junction where the collision cannot be clearly allocated to a particular road the highway authority of the major road is chosen.

¹ TLRN is the Transport for London Road Network.

² Includes Highways Agency roads

Note: the highway authority is allocated according to the category of the road at which the collision occurred. For a collision occurring at a junction where the collision cannot be clearly allocated to a particular road the highway authority of the major road is chosen.

5

Costs

5.1 DfT collision costs

Table 5.1 shows the latest available road collision costs by severity and road type for all hours of the day, as published by the Department for Transport in the *Accidents Sub-objective TAG Unit 3.4.1* on the *Transport Analysis Guidance (TAG)* web site (www.dft.gov.uk/webtag) in August 2012.

When assessing the potential savings from engineering remedial measures or other road safety schemes, it is normal practice to use the average collision cost, which includes an allowance for *damage only collisions*, (which are not recorded as part of the *Stats 19* national reporting system).

Table 5.1 Collision costs (£'s at 2010 prices)

| Type of collision | Urban roads ¹ | Rural roads ² | Motorways | All roads |
|--|--------------------------|--------------------------|----------------|----------------|
| Fatal collision | 1,820,760 | 1,920,646 | 2,052,377 | 1,882,872 |
| Serious collision | 206,791 | 232,594 | 246,217 | 215,837 |
| Slight collision | 21,556 | 25,638 | 30,231 | 22,814 |
| All injury collisions | 63,334 | 120,053 | 92,312 | 77,320 |
| Damage only collisions | 2,634 | 4,189 | 3,686 | 3,067 |
| All collision cost per injury collision (including an allowance for damage only collisions) | 93,809 | 139,149 | 110,044 | 104,720 |

Source: Department for Transport figures from the *Accidents Sub-objective TAG Unit 3.4.1 Transport Analysis Guidance* web site (www.dft.gov.uk/webtag) August 2012

1. Urban roads are considered those other than motorways with speed limits of 40mph or less

2. Rural roads are considered roads other than motorways with speed limits greater than 40mph

5.2 The cost to London

If the average collision cost for urban roads from Table 5.1 (£93, 809) is applied to the 24,443 personal injury collisions reported in the Greater London area during 2011, then the total cost to the community of all road collisions in Greater London is estimated to be over £2.3 billion at 2010 prices.

6

Appendices

Important notes about collision data

6.1 Comparing collision data from year to year

It is important to be aware of the following points when comparing collision data from year to year:

- (a) The increase in serious casualties in 2006, particularly for car occupants, was larger than expected. In conjunction with the Metropolitan Police Service (MPS), TfL investigated possible discrepancies in the 2004/05 casualty data, concentrating on the period between November 2004 and April 2005, when serious injuries were noticeably lower compared to subsequent months. Since then figures have returned to a more consistent trend. During this period there were several organisational changes within the MPS with regards to the collision and casualty data processing. Detailed investigations by MPS have not identified direct links between these changes and the apparent decrease in serious injuries during this period. Consequently, some of the increase in serious injuries in 2006 was probably as a result of comparing the 2006 data with the low data in 2005.
- (b) The numbers of collisions and casualties were changed for the years 1991 to 1997 as some previously missing collisions were reported by the City Police. This mainly affects the City of London and adjacent boroughs, as well as figures for inner London. As a result data contained in this annual report is not directly comparable with data in *annual reports* or *Factsheets* prior to 1998.
- (c) It should be noted that all the data in this report relates to the post-April 1995 Greater London borough boundaries. Because of this it is not possible to compare current Greater London collision and casualty totals or individual borough figures with those in annual reports prior to 1995.
- (d) During 1984, the Metropolitan Police improved their procedures for allocating the level of severity associated with reported collisions and recording fatalities. Changes in coding the level of severity were applied to collisions occurring after September 1984, though action on fatalities was backdated to cover all collisions for the whole of 1984. Consequently, care must be taken when comparing collisions on a year to year basis, particularly serious collisions, casualties and fatalities post 1984 with those occurring before 1984.

(e) Data for the City of London recorded by the City of London Police was added to the TfL database for collisions occurring in 1986 and onwards. Therefore, care must be taken when comparing collision and casualty totals for the whole of London or inner London, before and after 1986. Note that all of the tables and figures within this report, including the ten year trend graphs (Figures 1.1 to 1.7) and longer period trend graphs (Figures 1.8 to 1.10), include data for the City of London.

(f) Due to changes in Metropolitan Police administrative procedures, collision data for Heathrow Airport are not held for 1982 onwards. Care should be taken when comparing long term data on a year to year basis, particularly in the London Borough of Hillingdon, to which these collisions had previously been allocated.

(g) It should also be noted that the Department for Transport in its annual report *Road casualties Great Britain* include collision data for Heathrow Airport within both the London Borough of Hillingdon total and the Greater London total, up to and including the 2007 report. From the 2008 report, Heathrow is included in the Greater London total but shown as a separate authority.

6.1.2 Reporting levels of collisions and casualties

This report deals only with those collisions notified by the police under the Stats 19 national reporting system. It is well known from a number of hospital-based studies that there is a degree of under-reporting of casualties nationally. It is likely that data for London will be similarly affected. In the case of fatalities the figures contained in this report are almost certainly accurate, but for both serious and slight casualties there is probably a degree of under-reporting. However, because the methods of collection of collision data by the police remain consistent over time, it is reasonable to assume that there is consistency between figures for reported collisions over a period of years.

To try to quantify the amount of under-reporting of collisions in London, TfL commissioned a study *Reporting of Road Traffic Accidents in London: Matching Police Stats 19 records with Hospital Accident and Emergency Department Data'* by Transport Research Laboratory Ltd (TRL), which was completed in November 2002. This matched hospital collision and emergency department records of people injured on the roads around three representative hospitals, one each in outer, inner and central London, with police Stats 19 records of reported personal injury collisions. The report provided a best estimate of the reporting rate of 70%. The report is summarised in TfL's Safety Research Report No 1, published in September 2003.

If the best estimate of the reporting rate (70%) is applied to the 29,257 casualties reported to the police during 2011 it can be estimated that there may have been around 42,000 people injured on the roads in London in 2011.

6.1.3 Definitions of casualty severity

The following definitions are taken from *Stats 20: Instructions for the completion of Road Accident Reports – DfT October 2004*:

- **Fatal injury:** ‘fatal’ injury includes only those cases where death occurs in less than 30 days as a result of the accident. ‘Fatal’ does not include death from natural causes or suicide.
- **Serious injury:** examples of ‘serious’ injury are:
 - fracture
 - internal injury
 - severe cuts
 - crushing
 - burns (excluding friction burns)
 - concussion
 - severe general shock requiring hospital treatment
 - detention in hospital as an in-patient, either immediately or later
 - injuries to casualties who die 30 or more days after the accident from injuries sustained in that accident
- **Slight injury:** examples of ‘slight’ injury are:
 - sprains, not necessarily requiring medical treatment
 - neck whiplash injury
 - bruises
 - slight cuts
 - slight shock requiring roadside attention
 - (persons who are merely shaken and who have no other injury should not be included unless they receive or appear to need medical treatment)

Note: an injured casualty is coded by the police as seriously or slightly injured on the basis of information available within a short time of the collision. This generally will not include the results of a medical examination, but may include the fact of being detained in hospital, the reasons for which may vary somewhat from area to area.

6.1.4 Further information on this report

The processing and analysis of collision and casualty data in TfL is the responsibility of the Research and Data Analysis team, Surface Planning

Requests for collision and casualty information can be made:

- by e-mail :
sandra.cowland@tfl.gov.uk or michael.pilch@tfl.gov.uk
- by telephone: 020 3054 1079 or 1048
- or in writing :
Delivery Planning
Transport for London
Palestra
197 Blackfriars Road
London SE1 8NJ
